Pre-project baseline · Screaming Frog crawl · 7 October 2026

SEO audit for reactivehomeloans.com.au

Reactive Home Loans, home and commercial finance (Australia). This report records the technical and on-page condition of the site before any SEO work begins, so every change made from here can be measured against a fixed starting point.

9

HTML pages crawled

Within roughly 133 URLs assessed in total. No internal 404s or server errors were found.

39

Insecure HTTP URLs

29.32% of URLs crawled. One form also sits on an HTTP page and submits to an HTTP address.

8

Pages with no canonical tag

47.06% of pages assessed. One more page points its canonical at a different URL.

92

PageSpeed SEO score (mobile)

The one failed check is a "Resources" menu link that has no destination.

— 01 — Executive summary

A small, clean site. Security comes first.

Structurally this is a tidy website. The crawl found **9 HTML pages**, short and readable web addresses, **no broken internal pages**, **no server errors** and no duplicate page titles. Google's PageSpeed Insights gives it an SEO score of **92/100** on mobile. That is a good starting point.

The biggest problem is **security and trust**. Screaming Frog found **39 URLs still on insecure HTTP**, and one form sits on an HTTP page and sends its data to an HTTP address. For a finance business whose visitors enter personal and financial details, this comes before any ranking work.

The next problem is how the site *describes itself* to search engines. **8 pages have no canonical tag** and 1 points its canonical elsewhere. The **Calculators page has no H1**. Up to **4 pages have no meta description**, and 2 titles are long enough to be cut off. Three pages carry only about **110–115 words**.

None of this needs a rebuild. Most fixes are settings changes at the hosting, security plugin and SEO plugin level, and the critical items can be done in the first two weeks.

MOST URGENT

HTTPS is not enforced everywhere, including on a form

Screaming Frog reports **39 HTTP URLs** (29.32% of all URLs), **Form on HTTP URL** (1) and **Form URL Insecure** (1). Anything typed into that form can be read in transit, and browsers label pages like this "Not Secure".

HIGHEST VOLUME

Almost half the pages give Google no canonical signal

8 pages (47.06%) have no canonical tag. With HTTP and HTTPS versions of URLs both reachable, Google has to guess which version is the master copy.

ALREADY STRONG

Status codes and URL structure need no work

There are no internal 4xx or 5xx errors and only 2 internal redirects. No URL-structure issues were flagged, there are no missing or duplicate titles, and no missing image alt text was reported. These areas can be left alone.

— 02 — Website SEO health overview

Where the site stands, category by category

Each rating comes only from what the crawl actually measured. Categories the export could not assess are marked as such rather than guessed at.

HTTP status codes — Healthy
No internal 4xx or 5xx; 2 internal redirects

URL structure — Healthy
No URL issues flagged; lowercase, hyphenated

Page titles present & unique — Healthy
No missing or duplicate titles flagged

Image alt text — Healthy
No missing alt text flagged (≈45 images)

HTTPS & security — Critical
39 HTTP URLs, insecure form

Canonicalisation — Needs work
8 missing, 1 canonicalised

Crawlability — Needs work
1 no-response URL, 1 uncrawlable menu link

Heading structure — Needs work
1 page with no H1; order issues on 4

Meta descriptions — Monitor
1–4 missing, 1–3 over length

Meta titles — Monitor
2 of 9 exceed 60 characters

Content depth — Monitor
2–3 pages around 110–115 words

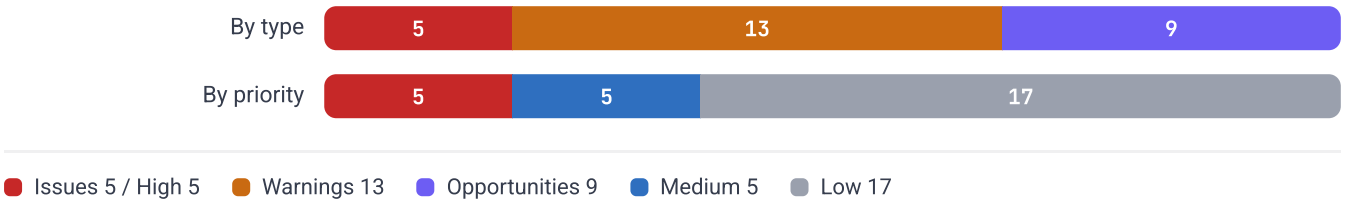

Security headers — Low
HSTS, CSP and others missing on most URLs

XML sitemap — No data
Not present in this export

Core Web Vitals — No data
Not present in this export

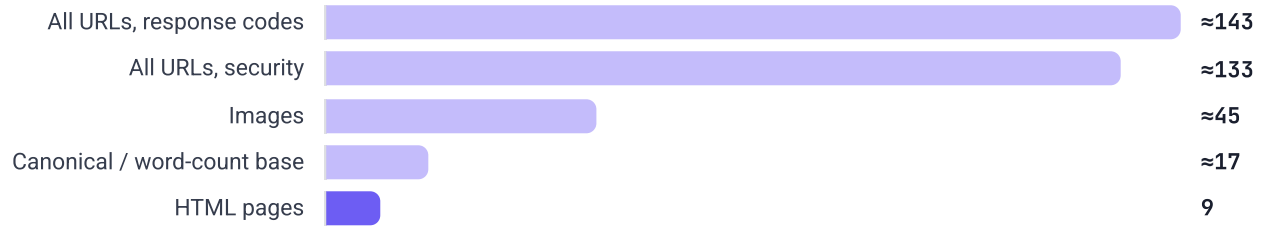

What Screaming Frog flagged

27 checks failed. Shown by type and by Screaming Frog's own priority rating.

Crawl scope by group

The export doesn't state totals. Each size below is calculated from Screaming Frog's own percentages (e.g. 4 URLs = 44.44% → 9 pages).

— 03 — Key findings

The issues found, ranked by impact

Percentages are Screaming Frog's own, so each one uses the base for that check (see section 02). Rows marked "Audit" come from the supplementary page-level audit export; "PSI" rows from PageSpeed Insights. The crawl date is not recorded in the export.

SEO issue	Current status	URLs	%	SEO impact	Priority
Insecure HTTP URLs	39 HTTP URLs found in the crawl	39	29.32%	"Not Secure" warnings; split link signals	Critical
Form on an HTTP page	Form served on an insecure page	1	0.75%	Enquiry data unencrypted; lost trust	Critical
Form submits to HTTP	Form action URL uses HTTP	1	0.75%	Data sent in the clear	Critical
Missing canonical tag	No canonical on 8 pages	8	47.06%	Google picks the version to index	High
Canonicalised page	Canonical points to a different URL	1	5.88%	Page excluded from the index	High
Internal URL with no response	Server returned nothing	1	0.70%	Dead end for users and crawlers	High
Uncrawlable menu link	"Resources" has no href (PSI)	1	–	Child pages may be missed	High
Missing H1	/calculators/	1	11.11%	No clear topic signal	High
Missing meta description	SF 1; Audit 4 incl. Commercial Asset Finance	1 (4)	11.11%	Google writes its own snippet	Medium
Thin content	110–115 words (Calculators, Terms, Disclaimer)	2 (3)	11.76%	Too little to rank on	Medium
Title over 60 characters	Home 64, Loan Types 62	2	22.22%	Truncated in results	Medium
Orphan pages	3 legal pages, no inlinks (Audit)	3	33%	Hard to discover	Medium
Missing HSTS header	Strict-Transport-Security absent	93	69.92%	Browsers may try HTTP first	Medium
Meta description too long	1 over 155 chars; 3 over 985px	1–3	11–33%	Snippet cut off	Low
Heading order	H1 not first (1); levels skip (3)	4	11–33%	Muddled outline	Low
Missing / duplicate H2	1 missing; 3 duplicated	1 / 3	11–33%	Weaker structure	Low
Links with no anchor text	Empty or unlabelled image links	4	44.44%	No context for the target	Low
Internal redirects	Internal links via 3xx	2	1.40%	Extra hop and latency	Low
Broken external links	Outbound 4xx	2	1.40%	Poor experience	Low
Images missing size attributes	No width/height	2	4.44%	Layout shift (CLS)	Low
Missing security headers	CSP, X-Frame, X-Content-Type, Referrer	130	97.74%	Security hardening only	Low

SEO issue	Current status	URLs	%	SEO impact	Priority
Unsafe cross-origin links	target="_blank" without noopener	9	6.77%	Legacy-browser risk	• Low

— 04 — Technical SEO audit

Protocol, security and delivery

Check	Result	Count	%	Assessment
HTTPS coverage	HTTP URLs encountered in the crawl	39	29.32%	● Fix
Form on HTTP page	Form served on an insecure page	1	0.75%	● Fix
Form action URL	Form submits to an HTTP address	1	0.75%	● Fix
HSTS header	Strict-Transport-Security missing	93	69.92%	● Add
Content-Security-Policy	Header missing	130	97.74%	● Harden
X-Frame-Options	Header missing	130	97.74%	● Harden
X-Content-Type-Options	Header missing	130	97.74%	● Harden
Referrer-Policy	No secure policy set	130	97.74%	● Harden
Unsafe cross-origin links	target="_blank" without rel="noopener"	9	6.77%	● Review
Internal server errors (5xx)	None flagged	0	0%	● Pass
Platform	WordPress 6.9.10 on PHP 8.3 (from site settings, context only)	–	–	● Note

TECH-01 39 URLs are still served over insecure HTTP

● Critical

Screaming Frog found **39 HTTP URLs**, which is 29.32% of everything it crawled. Browsers mark HTTP pages "Not Secure", HTTPS is a confirmed Google ranking signal, and when both versions of a page exist, link value is split between them.

The export doesn't say whether these URLs already redirect to HTTPS or are linked directly. That is shown in the *Security › HTTP URLs Inlinks* bulk export.

RECOMMENDED ACTION

Force HTTPS site-wide with a 301 redirect from HTTP to HTTPS, update every internal link, menu and image reference to HTTPS (a search-replace in WordPress), and then turn on HSTS.

TECH-02 A form sits on an HTTP page and submits to an HTTP address

● Critical

Two separate Screaming Frog checks fail on the same form: **Form on HTTP URL** and **Form URL Insecure**. For a business taking loan enquiries, the details typed in can include names, phone numbers and financial information. All of it is sent unencrypted.

RECOMMENDED ACTION

Identify the page (see *Bulk Export › Security › Form URL Insecure*), change the form's action URL to HTTPS, make sure the page itself only loads on HTTPS, and send a test enquiry to confirm submissions still arrive.

TECH-03 **Security response headers are missing on almost every URL** • Low

CSP, X-Frame-Options, X-Content-Type-Options and Referrer-Policy are each missing on **130 URLs (97.74%)**, and HSTS is missing on **93 (69.92%)**. Google doesn't rank on these headers, but they protect visitors from clickjacking and injected scripts. HSTS also directly supports TECH-01.

RECOMMENDED ACTION

Set these headers once at server, CDN or security-plugin level, starting with HSTS after HTTPS is enforced. Test CSP carefully so the site's own scripts and forms keep working.

DATA GAP

Page speed was not measured in this export

The only performance-related finding is **2 images missing width/height attributes** (section 12), which can cause layout shift. The export contains no response times, page weights or Core Web Vitals. The PageSpeed screenshot supplied covers the SEO category only. Run Lighthouse Performance on key pages to complete this baseline.

— 05 — Crawlability & indexability

What Google can reach, and what gets in its way

The export has no noindex, nofollow or robots.txt-blocked findings, so nothing appears to be excluded on purpose. Three things still get in the crawler's way.

CRAWL-01 **One internal URL returned no response at all** • High

Screaming Frog's **Internal No Response** check failed on 1 URL (0.70%). The server returned nothing, which is usually caused by a malformed link, a timeout or a firewall blocking the request. Anyone who follows that link, visitor or crawler, hits a dead end.

RECOMMENDED ACTION

Export *Response Codes › Internal › No Response inlinks* to find the URL and the pages linking to it. Correct the link or the server rule, then re-test.

CRAWL-02 **The "Resources" menu item cannot be followed by search engines** • High

PageSpeed Insights failed the **Links are not crawlable** check on `<a aria-expanded="false" class="menu-link">`, labelled "Resources". It has no `href`, so it opens a dropdown for visitors but gives search engines nothing to follow. It sits in the main navigation, so any page reached only through it is at risk of being missed.

RECOMMENDED ACTION

Point "Resources" to a real Resources page, or confirm that every page in its dropdown is also linked normally in the navigation or footer.

CRAWL-03 **The three legal pages have no internal links pointing to them** • Medium

The supplementary audit flags these pages as orphans: they are known to exist but nothing on the site links to them. Screaming Frog cannot find a page like this by following links. For a finance business, the privacy policy and disclaimer are also trust and compliance pages that visitors expect to find.

Affected URLs

/privacy-policy/ · /terms-and-conditions/ · /disclaimer/

RECOMMENDED ACTION

Add all three to the site footer. Then decide whether Terms and Disclaimer should be indexed at all (see DUP-01).

robots.txt rules • No data
Directives not included in this export

XML sitemap • No data
No sitemap data in the crawl

Search Console coverage • No data
Requires GSC access

— 06 — On-page SEO analysis

Page by page, where the gaps sit

Screaming Frog reports counts without URLs, so this table uses the supplementary audit, which names the pages. The other 2 of the 9 HTML pages had no page-level findings.

Page	Title	Meta description	H1	Heading order	Words	Inlinks
/ (homepage)	• 64 chars	–	–	–	–	–
/loan-types/	• 62 chars	–	–	–	–	–
/loan-types/commercial-asset-finance/	–	• Missing	–	–	–	–
/calculators/	–	–	• Missing	–	115	–
/terms-and-conditions/	–	• Missing	–	• Skips	112	• Orphan
/disclaimer/	–	• Missing	–	• Skips	110	• Orphan
/privacy-policy/	–	• Missing	–	• Skips	–	• Orphan

"–" means no issue was reported for that page in that column. Word counts are given only for pages flagged as thin.

PAGE-01 **The Calculators page has no H1 and only 115 words** • High

Calculators is a natural landing page for searches like "home loan repayment calculator", but it gives Google the least to go on. It has no main heading and 115 words of readable text. If the calculators are built in JavaScript, Google may see even less than a visitor does.

RECOMMENDED ACTION

Add one descriptive H1 (for example "Home loan calculators"), give each calculator a short explanation of what it works out, and confirm the text is visible in the page source rather than only rendered by script.

WHERE THE TWO EXPORTS DIFFER

Missing descriptions: 1 vs 4. Thin pages: 2 vs 3.

Screaming Frog counts 1 missing meta description and 2 low-content pages. The supplementary audit counts 4 and 3. The likely causes are different crawl times and different ways of defining the main content area. The plan uses the larger figures so nothing is missed. Screaming Frog's figures remain the official baseline, and the re-crawl will use the same Screaming Frog settings so before and after are comparable.

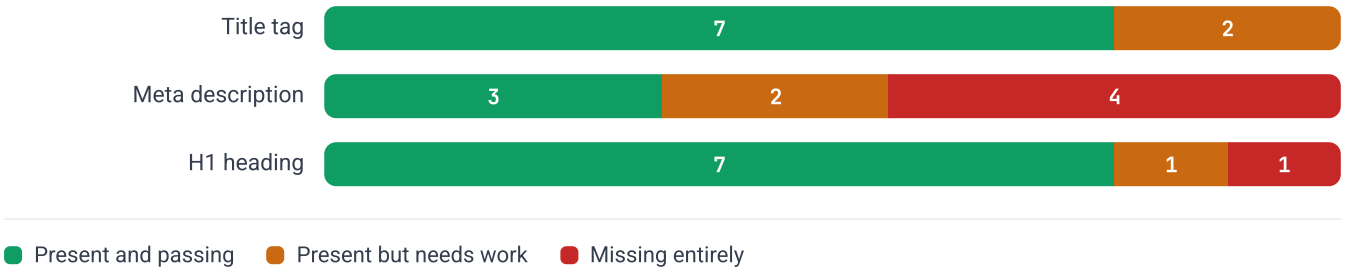

— 07 — Metadata analysis

Titles and descriptions, the site's shopfront in search results

Every page has a unique title, which is the hard part done. The gaps are length and missing descriptions.

Metadata coverage across the 9 HTML pages

Each bar totals 9 pages. Based on Screaming Frog counts. Descriptions show the larger figure from the supplementary audit.

Meta description "needs work" is shown as 2 because the 3 pages over 985px may overlap the 1 over 155 characters and the missing ones. The page-level split will be confirmed in the re-crawl.

Meta title findings

Issue	Current status	URLs	%	SEO impact	Priority	Recommended action
Missing title	None flagged	0	0%	—	• Pass	No action required.
Duplicate titles	None flagged	0	0%	—	• Pass	No action required.
Over 60 characters	Home 64, Loan Types 62	2	22.22%	Truncated in results	• Medium	Rewrite to 50–60 characters with the main keyword in the first 40.
Over 561 pixels	Same 2 titles	2	22.22%	Truncated in results	• Medium	Check pixel width in a SERP preview when rewriting.

Meta description findings

Issue	Current status	URLs	%	SEO impact	Priority	Recommended action
Missing entirely	SF 1; Audit 4: Commercial Asset Finance + 3 legal pages	1 (4)	11.11%	Google writes its own snippet	High	Write a unique 120–155 character description, starting with Commercial Asset Finance.
Over 155 characters	1 description	1	11.11%	Cut off mid-sentence	Low	Trim with the key benefit first.
Over 985 pixels	Google's display limit	3	33.33%	Cut off on desktop	Low	Prioritise these over the character-count case.
Duplicate across pages	None flagged	0	0%	—	Pass	No action required.

META-01 **A money page has no meta description** — Medium

`/loan-types/commercial-asset-finance/` is a service page with real commercial intent, and it has no description. Google will build a snippet from whatever text it finds first on the page, which is rarely the most persuasive summary. The three legal pages are missing descriptions too, but they matter far less.

RECOMMENDED ACTION

In the SEO plugin, write a description for Commercial Asset Finance first, naming the finance types covered and a reason to enquire. Then add short factual ones to the legal pages.

— 08 — Heading structure

H1 and H2 hierarchy

An H1 is the page's main headline. H2s and H3s mark its sections, in order, the way a table of contents would.

Issue	Current status	URLs	%	SEO impact	Priority	Recommended action
Missing H1	/calculators/	1	11.11%	No clear topic signal	High	Add one descriptive H1 matching the title.
H1 not first heading	Another heading sits above the H1	1	11.11%	Muddled outline	Low	Make the H1 the first heading on the page.
Heading levels skip	Terms, Disclaimer, Privacy (Audit)	3	33%	Structure & accessibility	Low	Use H1 → H2 → H3 in order.
Missing H2	1 page	1	11.11%	Harder to scan	Low	Add H2s for the main sections.
Duplicate H2	Same H2 text on 3 pages	3	33.33%	Pages look alike	Low	Make section headings page-specific.
Multiple H2s	7 pages	7	77.78%	Not a problem	Pass	Normal; Screaming Frog flags it for review only.

HEAD-01 **Heading order breaks on four pages** Low

On one page another heading appears above the H1. On the three legal pages the levels skip, for example jumping from H2 to H4. Neither is a ranking problem on its own, but both make the page outline harder for search engines and screen readers to follow. Screen readers matter for accessibility obligations.

RECOMMENDED ACTION

In the page editor, set the H1 as the first heading and step down one level at a time. Where a heading is only used for its size, change it to styled text instead.

— 09 — URL & canonical analysis

URLs are clean. Canonical tags are not.

URL structure

No URL issues flagged by Screaming Frog.

Lowercase only No uppercase flagged	Pass
Hyphens, not underscores No underscores flagged	Pass
No parameters None flagged	Pass
Logical folders e.g. /loan-types/commercial-asset-finance/	Pass
HTTPS on every URL 39 HTTP URLs found	Fail

Canonical tags

A canonical names the definitive version of a page.

No canonical tag 8 pages (47.06%)	High
Canonicalised elsewhere 1 page (5.88%)	High
Self-referencing Remainder of the ≈17 assessed	Pass

CANON-01 **Eight pages give Google no canonical signal** High

A canonical tag tells Google "this address is the master copy of this page". Without one, Google picks its own. That is a real risk on this site because **39 HTTP URLs** exist alongside their HTTPS versions, so the wrong version could be indexed or ranking signals split between the two.

RECOMMENDED ACTION

Turn on self-referencing HTTPS canonicals in the SEO plugin so every indexable page outputs one automatically. Then confirm in the re-crawl that the count reaches 0.

CANON-02 **One page tells Google to index a different URL** • High

Screaming Frog classes 1 page as **Canonicalised**: its canonical points somewhere else, so it is excluded from search results. That is correct if it's a duplicate or HTTP variant. If it's a real page, it's being hidden from Google by mistake.

RECOMMENDED ACTION

Identify the URL from the *Canonicals › Canonicalised* filter. Correct the canonical if the page should rank. If it's a variant, update internal links to point at the canonical version.

— 10 — Redirects & HTTP status codes

Mostly a clean bill of health

Almost every URL the crawler requested loaded successfully. Percentages use the ≈143 URLs checked for response codes.

Status	Meaning	URLs	%	Assessment
Internal 3xx redirects	Linked page has moved	2	1.40%	• Low
Internal 4xx	Broken internal link	0	0.0%	• None found
Internal 5xx	Server failure	0	0.0%	• None found
Internal no response	Server returned nothing	1	0.70%	• High
External 4xx	Broken outbound link	2	1.40%	• Low

STAT-01 **Two internal links go through redirects, and two external links are broken** • Low

Each redirect adds a short delay for visitors and a little wasted effort for crawlers. The 2 broken external links send visitors to an error page on another site. Some sites return 403 to crawlers but load fine in a browser, so these need checking before they are removed.

RECOMMENDED ACTION

Point the 2 internal links straight at their final URL and check for chains. Open each external link in a browser, then update or remove it.

SCOPE NOTE

This covers what the crawler could reach

Server-level redirects such as HTTP → HTTPS or www → non-www show up here only when something links to them. Whether the 39 HTTP URLs already redirect will be confirmed from the inlinks export and Google Search Console.

— 11 — Internal linking analysis

Navigation carries the site, with two gaps

Internal links pass authority around a site and tell Google which pages matter. The export doesn't include per-page inlink counts, so these findings come from the issue filters.

Issue	Current status	URLs	%	SEO impact	Priority	Recommended action
Uncrawlable menu link	"Resources" has no href (PSI)	1	–	Link value cannot flow	High	Give it a real destination.
Orphan pages	3 legal pages (Audit)	3	33%	Hard to discover	Medium	Link from the footer.
Links with no anchor text	Empty link text or unlabelled linked images	4	44.44%	No context for Google or screen readers	Low	Add descriptive text, or alt text on linked logos and icons.

LINK-01 **Four pages contain links with no anchor text** — Low

Anchor text is the clickable wording of a link, and it tells Google what the destination is about. On 4 of the 9 pages at least one link has none. This is typically a logo, social icon or image button with no alt text.

RECOMMENDED ACTION

Add alt text to linked images, such as "Reactive Home Loans home" on the logo, and replace any empty or icon-only text links with descriptive wording.

— 12 — Image SEO

Images are in good shape

About 45 images were crawled. Only one image check failed.

Check	Result	Images	%	Assessment
Missing alt text	Not flagged	0	0%	Pass
Alt text over 100 characters	Not flagged	0	0%	Pass
Missing size attributes	No width/height in HTML	2	4.44%	Low
File size / format	Not present in this export	–	–	No data

IMG-01 **Two images have no width or height set** — Low

Without dimensions, the browser can't reserve space for an image, so text jumps when it loads. This shows up as Cumulative Layout Shift (CLS), one of Google's Core Web Vitals.

RECOMMENDED ACTION

Add width and height attributes that match each image's real size. Most WordPress image blocks do this automatically, so the culprits are likely theme or builder images.

DATA GAP

Alt text quality and file weight were not assessed

Screaming Frog confirms alt text is *present*, but not that it is descriptive. File sizes and formats such as WebP aren't in this export. Exporting *Images › All* from the same crawl closes this gap without a re-crawl.

— 13 — Duplicate & thin content

No duplication. Thin pages are the real issue.

Check	Result	URLs	Assessment
Duplicate title tags	None flagged	0	• Pass
Duplicate meta descriptions	None flagged	0	• Pass
Duplicate H2	Same H2 on 3 pages	3	• Low
Low content (<200 words)	SF 2 pages (11.76%); Audit 3 pages at 110–115 words	2 (3)	• Medium
Near-duplicate detection	Not present in this export	–	• No data

DUP-01 **Three pages carry around 110 words each** • Medium

The supplementary audit measures **Calculators at 115 words**, **Terms and Conditions at 112** and **Disclaimer at 110**. These pages need different fixes. Calculators is a page that should rank, so it needs supporting copy (PAGE-01). The legal pages rarely need to rank, and padding them adds nothing.

Affected URLs

`/calculators/ · 115 words · /terms-and-conditions/ · 112 words · /disclaimer/ · 110 words`

RECOMMENDED ACTION

Expand Calculators with helpful context. For Terms and Disclaimer, keep the content as is, link them from the footer, and consider setting them to noindex so they don't dilute the site's topical focus.

— 14 — Priority issues & recommendations

Everything found, in the order it should be fixed

Priority combines the likely cost to rankings, trust and enquiries with how quickly the issue can be fixed. Critical items put visitor data and credibility at risk.

Critical

• Fix in week 1

SEO issue	Current status	URLs	%	SEO impact	Recommended action
Insecure HTTP URLs	39 HTTP URLs found in the crawl	39	29.32%	"Not Secure" warnings; split link signals	Force HTTPS with 301s; update internal links to HTTPS.
Form on an HTTP page	Form served on an insecure page	1	0.75%	Enquiry data unencrypted; lost trust	Serve the form page only over HTTPS.
Form submits to HTTP	Form action URL uses HTTP	1	0.75%	Data sent in the clear	Change the action URL to HTTPS; test a submission.

High priority

• Weeks 2–4

SEO issue	Current status	URLs	%	SEO impact	Recommended action
Missing canonical tag	No canonical on 8 pages	8	47.06%	Google picks the version to index	Turn on self-referencing HTTPS canonicals.
Canonicalised page	Canonical points to a different URL	1	5.88%	Page excluded from the index	Confirm the target; fix if the page should rank.
Internal URL with no response	Server returned nothing	1	0.70%	Dead end for users and crawlers	Find via inlinks export; fix the link.
Uncrawlable menu link	"Resources" has no href (PSI)	1	–	Child pages may be missed	Give the menu item a real destination.
Missing H1	/calculators/	1	11.11%	No clear topic signal	Add one descriptive H1.

Medium priority

• Weeks 2–8

SEO issue	Current status	URLs	%	SEO impact	Recommended action
Missing meta description	SF 1; Audit 4 incl. Commercial Asset Finance	1 (4)	11.11%	Google writes its own snippet	Write unique 120–155 char descriptions.
Thin content	110–115 words (Calculators, Terms, Disclaimer)	2 (3)	11.76%	Too little to rank on	Expand Calculators; noindex legal pages.
Title over 60 characters	Home 64, Loan Types 62	2	22.22%	Truncated in results	Rewrite to 50–60 characters.
Orphan pages	3 legal pages, no inlinks (Audit)	3	33%	Hard to discover	Link from the footer.
Missing HSTS header	Strict-Transport-Security absent	93	69.92%	Browsers may try HTTP first	Turn on after HTTPS is enforced.

Low priority

● As capacity allows

SEO issue	Current status	URLs	%	SEO impact	Recommended action
Meta description too long	1 over 155 chars; 3 over 985px	1–3	11–33%	Snippet cut off	Trim with the benefit first.
Heading order	H1 not first (1); levels skip (3)	4	11–33%	Muddled outline	Step H1 → H2 → H3 in order.
Missing / duplicate H2	1 missing; 3 duplicated	1 / 3	11–33%	Weaker structure	Make H2s page-specific.
Links with no anchor text	Empty or unlabelled image links	4	44.44%	No context for the target	Add text or alt text.
Internal redirects	Internal links via 3xx	2	1.40%	Extra hop and latency	Link to the final URL.
Broken external links	Outbound 4xx	2	1.40%	Poor experience	Update or remove.
Images missing size attributes	No width/height	2	4.44%	Layout shift (CLS)	Add width and height.
Missing security headers	CSP, X-Frame, X-Content-Type, Referrer	130	97.74%	Security hardening only	Set once at server level.
Unsafe cross-origin links	target="_blank" without noopener	9	6.77%	Legacy-browser risk	Add rel="noopener".

— 15 — SEO action plan

An eight-week sequence, ordered by dependency

Security and indexing come first, so the on-page work that follows is credited to the right, secure URLs.

WEEK 1 · SECURE

Close the trust gap

- Export the 39 HTTP URLs with their inlinks; force a 301 redirect from HTTP to HTTPS site-wide
- Search-replace internal http:// links, menus and image references to https://
- Move the insecure form to HTTPS (page and action URL) and send a test enquiry
- Find and fix the internal URL that returns no response
- Check robots.txt and the XML sitemap, neither of which was captured in this export

WEEKS 2–4 · FOUNDATIONS

Fix what every page depends on

- Turn on self-referencing HTTPS canonicals; review the 1 canonicalised URL
- Turn on HSTS once HTTPS is confirmed everywhere
- Give the "Resources" menu item a real link
- Add an H1 and supporting copy to Calculators
- Write a meta description for Commercial Asset Finance and the 3 legal pages
- Link the legal pages from the footer; decide on noindex for Terms and Disclaimer
- Re-crawl to confirm the week 1 fixes registered

WEEKS 5–8 · OPTIMISE

Sharpen what is already working

- Rewrite the Home and Loan Types titles to 50–60 characters
- Trim the 1–3 over-length meta descriptions
- Fix heading order on the 4 affected pages; make duplicate and missing H2s specific
- Add anchor or alt text to empty links on 4 pages; add size attributes to 2 images
- Point 2 internal links past their redirects; fix or remove 2 broken external links
- Add CSP, X-Frame-Options, X-Content-Type-Options and Referrer-Policy headers; add rel="noopener" to new-tab links

ONGOING · MEASURE

Prove the work landed

- Re-crawl monthly with identical Screaming Frog settings and compare against section 16
- Run Lighthouse Performance on key pages to add Core Web Vitals to the baseline
- Connect Google Search Console to track indexing, impressions and clicks
- Re-run PageSpeed Insights SEO; target 100 once the menu link is fixed

— 16 — Before-SEO baseline summary

The numbers to measure against

Every figure comes from the Screaming Frog export unless marked Audit or PSI. Re-run the same crawl with the same settings after each phase and compare like for like.

Metric	Baseline · Oct 2026	Target	Why it matters
HTML pages crawled	9	9+	Grows as content is added
Total URLs assessed (security)	≈133	—	Crawl scope; keep settings identical
Screaming Frog issue types flagged	27	under 10	Overall hygiene
High-priority issue types (SF)	5	0	The items that block trust and indexing
HTTP (insecure) URLs	39 (29.32%)	0	Security and a confirmed ranking signal
Insecure forms (page / action)	1 / 1	0 / 0	Protects enquiry data
Internal URLs with no response	1 (0.70%)	0	No dead ends
Internal redirects (3xx)	2 (1.40%)	0	Direct links, no hops
Internal 4xx / 5xx	0 / 0	0 / 0	Already ideal; protect it
External broken links (4xx)	2	0	User experience
Pages missing a canonical	8 (47.06%)	0	Controls the indexed version
Canonicalised pages	1 (5.88%)	0 unintended	Keeps real pages indexable
Pages missing meta description	1 (Audit 4)	0	Controls the snippet shown
Meta descriptions over 155 chars / 985px	1 / 3	0 / 0	Prevents truncation
Titles over 60 chars / 561px	2 / 2	0 / 0	Prevents truncation
Pages missing an H1	1 (11.11%)	0	Establishes page topic
Heading order issues	4	0	Clean outline and accessibility
Low content pages	2 (Audit 3)	0 indexable	Depth on commercial pages
Orphan pages	3 (Audit)	0	Discoverability
Pages with empty-anchor links	4 (44.44%)	0	Link context
Images missing size attributes	2 (4.44%)	0	Layout stability (CLS)
URLs missing HSTS	93 (69.92%)	0	Enforces HTTPS in the browser
URLs missing other security headers	130 (97.74%)	0	Visitor protection
Uncrawlable links (PSI)	1	0	Navigation fully crawlable
PageSpeed Insights SEO (mobile)	92	100	Lighthouse SEO checks pass

Crawl configuration for repeat runs: Screaming Frog SEO Spider, same configuration as this crawl. The crawl date and settings aren't recorded in the export, so record both on the next run. Sizes marked ≈ are calculated from Screaming Frog's percentages.

— 17 — What this audit could not measure

Gaps, stated plainly

These are standard parts of a full SEO audit. None of them appear in the data supplied, so no findings are claimed about them either way.

Not assessed	Why it is missing	What would be needed
Affected URLs per issue	Issues Overview gives counts only	Screaming Frog bulk exports for HTTP URLs, canonicals, redirects and no-response inlinks.
XML sitemap	No sitemap data in the crawl	Crawl with "Crawl Linked XML Sitemaps" on, or supply the sitemap URL.
robots.txt directives	Not included in this export	Fetch robots.txt directly or use Screaming Frog's tester.
Core Web Vitals & speed	No performance data in the export	Lighthouse or PageSpeed Insights Performance, or the PSI API connected to the crawl.
Crawl depth & inlink counts	Issues export has no per-page link data	Internal › HTML export from the same crawl.
Structured data / schema	Not in this export	Re-crawl with Structured Data validation. FinancialService and LocalBusiness schema are relevant.
Open Graph / social tags	Not in this export	Per-page check of og:image and og:description.
Near-duplicate content	Not in this export	Enable Near Duplicates and run Crawl Analysis.
Index coverage as Google sees it	A crawler reports what it can reach	Google Search Console Pages report.
Rankings, traffic, backlinks	Outside the scope of a crawler	Search Console, Google Analytics 4 and a backlink tool.

SEO baseline audit · reactivehomeloans.com.au · Reactive Home Loans
Source data: Screaming Frog SEO Spider Issues Overview export (27 issue rows); supplementary page-level audit export (16 rows, 7 URLs); PageSpeed Insights mobile SEO report.
All counts and percentages are taken directly from those sources. Sizes marked ≈ are calculated from Screaming Frog's percentages. Items the data does not cover are listed in section 17 and are not estimated.
